ART SA AMUT

CLAIMS

16

1. A method of operating a transmitter to transmit a data block to a plurality of recipients selected from a plurality of receivers connected to said transmitter via a multicast-capable network, said method comprising:

finding a multicast address to which said data block is to be sent, said multicast address being suitable for use in said multicast-capable network;

10 addressing said data block to said multicast address; and

transmitting said data block over said network;

said method being characterised in that:

said transmitter has access to one or more directories storing:

- a) a plurality of lists of receiver identifiers; and
- 20 b) for each of said lists, a multicast-address suitable for use in said multicast-capable network; and

said multicast address finding step comprises:

- 25 a) obtaining a list of receiver identifiers, said list corresponding to the set of recipients to which said data block is to be sent; and
 - b) examining said one or more directories to find a multicast address corresponding to the list of receiver identifiers obtained in step a).
 - A method according to claim 1 wherein: said obtaining step comprises:

- a) receiving one or more indications that an earlier data block addressed to a selected set of receivers was not successfully received by one or more of said set of receivers; and
- b) analysing said indications to generate a list of receiver identifiers, each receiver 5 Identifier in said list identifying a recipient that did not successfully receive said earlier data block.
 - A method according to claim 1 wherein: 3. said obtaining step involves:
- 10 a) determining that a general data block is to be sent to recipients included in one or more of a selected plurality of said lists; and
 - b) unifying said selected plurality of lists to find a unified list of receiver identifiers.
- A method according to claim 1 wherein said transmitter further has access to 4. 15 type data listing data block type identifiers, and a list of recipient identifiers for each data block type identifier, wherein said obtaining step involves:
 - a) finding a type identifier associated with said data block; and
 - b) examining said type data to find a list of receiver identifiers associated with said type identifier.
 - A method according to claim 4 wherein said type identifier is a subject-matter 5. Identifier indicating the subject-matter to which the data in the data block relates,
- A method according to claim 4-er-5 wherein said type identifier finding step 25 Involves extracting a type identifier from a data block received at said transmitter.
 - 7. A method according to claim 1 wherein said transmitter has access to a plurality of group directories for respective groups of receivers.
- A method according to any preceding claim wherein the format of said multicast address is in accordance with the Internet Protocol suite.

18

- 9. A transmitter operable to transmit data blocks to a set of recipient computers selected from a plurality of receiver computers connectable to said transmitter computer via a multicast-capable network, said apparatus comprising:
- 5 an output connectable to said network;

one or more processors;

a program store storing instructions executable by said one or more processors to transmit the data block via said output over said network;

said set of instructions being executable to transmit the data block by:

finding a multicast address to which said data block is to be sent, said multicast address being suitable for use in said multicast-capable network;

addressing said data block to said multicast address; and

transmitting said data block over said network;

20

said transmitter being characterised by:

having access to a directory store storing:

- 25 a) list data representing lists of receiver identifiers; and
 - b) for each of said lists, a multicast address suitable for use in said multicast-capable network; and
- 30 said set of instructions being executable to find said multicast address by:
 - a) obtaining a list of receiver identifiers, said list corresponding to the set of recipients to which said data block is to be sent; and

b) examining said one or more directories to find a multicast address corresponding to the list of receiver identifiers obtained in step a).

19

10. A transmitter according to claim 9 wherein:

said transmitter further has access to type data listing data block type identifiers, and a. list of recipient identifiers for each data block type identifier; and said set of instructions being further executable to obtain said list of receiver identifiers by:

- 10 a) finding a type identifier associated with said data block; and b) examining said type data to find a list of receiver identifiers associated with said type
- 15 11. A program storage device readable by a processing apparatus, said device embodying a program of instructions executable by the processing apparatus to perform method steps for transmitting a data block over a network to a set of recipients selected from a plurality of receivers, said method steps comprising steps according to A any one of claims 1 to 8.
- 12. A computer program comprising computer program code adapted to perform the method steps of any one of claims 1 to 8 when said program is executed by a computer.
